[?Bees Of The Genus Osmia In The Collection Of The ...](#)

Mason bee is a name now commonly used for species of bees in the genus Osmia, of the family Megachilidae. Mason bees are named for their habit of using mud or other "masonry" products in constructing their nests, which are made in naturally occurring gaps such as between cracks in stones or other small dark cavities. When available, some species preferentially use hollow stems or holes in wood made by wood-boring insects. Species of the genus include the orchard mason bee O ...

[Osmia lignaria - Wikipedia](#)

Wild bees are important pollinators for agricultural crops and solitary species such as Osmia bicornis are particularly suitable for pollination management. Wild bees share floral resources with managed honey bees and may be exposed to emerging infectious diseases. Although studies have explored the prevalence of pathogens in solitary wild bee species, data regarding the impact of pathogens on ...

Mason bees (members of the genus Osmia) and leaf cutter bees (members of the genus Megachile) are similar in many ways: they carry pollen on their bellies rather than on their hind legs and they nest in holes. When building their nests, mason bees do not use cut leaves they way that leaf cutters do; mason bees use clay to make partitions and to seal the entrance. This unique mud-building ...

???? Eight subgenera of the genus Ceratina Latreille (Anthophoridae) are recognized from Asia and West Pacific; they are Chloroceratina, Lioceratina, Xanthoceratina, Catoceratina, Ceratinidia, Ceratina sensu stricto, Neoceratina and Euceratina. Comments are made on the remaining subgenera of the world and the American species Ceratina arizonensis now found on Oahu, Hawaiian Islands.

It further enables a clearer suprageneric subdivision of the Osmiini than that suggested by Michener (2007): the genus Chelostoma clearly emerged as the sister group of all other osmiine bees (Figure 1) and thus deserves the same rank as the Heriades group and the Osmia group, often recognized as subtribes Heriadina and Osmiina, respectively (Engel, 2005; Ungricht et al., 2008).

Moreover, with the subgenus Bytinskia, the genus Hoplitis comprises the only kleptoparasitic bees amongst the Osmiini (Mavromoustakis, 1954; Warncke, 1991b). Whereas nesting in excavated ground burrows is considered the ancestral condition in bees of the family Megachilidae (Litman et al ., 2011), the ancestral nesting habit in the genus Hoplitis is unknown as are evolutionary patterns of ...
